MPHYS NOTES

Applied Nuclear Physics

Dave Scott

Based on a course by Prof. John Billowes

July 4, 2018

Contents

Chapter 1

Interaction of Radiation with Matter

1.1 Theory and General Features for Charged Particles

1.1.1 The Bethe-Bloch Equation

1.2 Photon Interactions

1.2.1 Photoelectric Effect

1.2.2 Compton Scattering

1.2.3 Pair Production

1.3 Neutron Scattering and Absorption

1.4 Attenuation and Shielding

Chapter 2

Radiation Detection

2.1 Gas-Filled Counters

2.1.1 Ionisation Chambers

2.1.2 Proportional Counters

2.1.3 Geiger Counters

2.2 Scintillators

2.2.1 Properties of Different Phosphors

2.3 Semiconductor Detectors

2.3.1 Silicon

2.3.2 Germanium

Chapter 3

Biological Effects of Radiation

3.1 Stages of Damage in Tissue

3.2 Radiation Dosimetry

3.2.1 Activity

3.2.2 Dose

3.2.3 Quality Factor

3.3 Radiobiological Effects

3.3.1 Molecular Damage and Repair

3.3.2 Cell Survival

3.4 Human Exposure and Risk

3.5 Environmental Factors

Chapter 4

Nuclear Fission

4.1 Fission and Nuclear Structure

4.1.1 Energy in Fission

4.2 Fission Products

4.2.1 Prompt Neutrons

4.2.2 Delayed Neutrons

4.2.3 Chain Reactions

4.2.4 Critical Mass

4.3 Role of Thermal Neutrons

4.3.1 Neutron Moderation

4.4 The Thermal Fission Reactor

4.4.1 The Nuclear Economy

4.4.2 Criticality

4.5 Homogeneous Reactor Examples

Chapter 5

Nuclear Fusion

5.1 Basic Reactions and Energetics

5.2 Stellar Fusion and Nucleogenesis

5.3 Controlled Fusion

5.3.1 Plasma Confinement

5.3.2 Laser Implosion

Chapter 6

Applications of Nuclear Techniques

6.1 Nuclear Forensics and Safeguards

6.2 Dating Techniques

6.3 Radiation Diagnosis and Therapy
